Every year cholera affects thousands of people. *Vibrio cholerae*, the agent which causes cholera, thrives in brackish waters of estuaries as well as in coastal seawaters, and even freshwater in rivers, canals, ponds, or lakes, if saline levels are compensated by warmth and organic nutrients. This is a picture from a swamp in Lukanga which is a major wetland in the Central Province of Zambia in Africa. Cholera continues to thrive in this region.
Oral Cholera Vaccines reduce the chances of getting infected with cholera. Taking the OCV can protect you from getting sick from cholera. The Oral Cholera Vaccine Campaign is part of the efforts to control cholera in your community, and is complementary to reinforcing access to safe water and sanitation.

List of StopCholera.Org Blogs

1. “Why is this outbreak different from others?” [1] An Interview with Waqo Boru, Epidemiologist, Field Epidemiology and Laboratory Training Program, Ministry of Health Kenya (March 5, 2019) (Author: Brittany Goetsch, MA, MPH)
